# Day 2 Machine Test – Shell Scripting (Input & Output)

**Instructions:**
• Create all scripts inside your Day 2 Shell Scripting repository.
• Push the updated repository to GitHub.
• Submit the updated Day 2 repository link in Google Classroom.
• Use proper script names and follow shell scripting best practices.

## Question 1 – Personal Information Script

Create a shell script named **personal_info.sh** that: Accepts the user's Name, Age, and City using read -p. Displays all entered details in a clear format. Expected Output Format: User Details Name: <name> Age: <age> City: <city>

## Question 2 – Student Registration Form

Create a shell script named **student_registration.sh** that: Accepts Student Name, Course, and Batch from the user. Displays all details after input collection. Use separate variables for each input. Use echo for displaying output.

## Question 3 – Login Form

Create a shell script named **login.sh** that: Accepts Username using read -p. Accepts Password using hidden input (read -s -p). Displays a success message after capturing the credentials.

## Question 4 – Server Registration Script

Create a shell script named **server_registration.sh** that: Accepts Server Name and Environment from the user. Displays the collected information.

## Question 5 – Deployment Script

Create a shell script named **deployment.sh** that: Accepts Application Name and Environment. Displays Application Name, Environment, and Deployment Started. Use a single echo -e statement with \n.

## Question 6 – Multiple Variable Input

Create a shell script named **employee.sh** that: Accepts Employee Name and Employee ID in a single read command. Displays both values separately.

## Question 7 – System Information Script

Create a shell script named **system_info.sh** that: Stores the output of whoami, date, and pwd into variables. Displays all values using echo.

## Question 8 – User Information Script

Create a shell script named **userinfo.sh** that displays: Current User Home Directory Current Shell Store values in variables before displaying them.

## Question 9 – Read-Only Variable

Create a shell script named **company.sh** that: Creates a read-only variable named company. Assigns a company name to it. Displays the value using echo.

## Question 10 – Mini Project: DevOps Registration Portal

Create a shell script named **devops_registration.sh** that: Accepts Candidate Name, Technology, Batch, and Preferred Environment. Displays all collected information in a professional format.

## Submission

• Commit all scripts to your Day 2 Shell Scripting GitHub repository.
• Push the latest changes to GitHub.
• Submit the updated repository link in Google Classroom.
